

WEEK – 11

Create an application to implement flutter calendar.

AIM: To create a Flutter application that displays calendar.

PROGRAM:

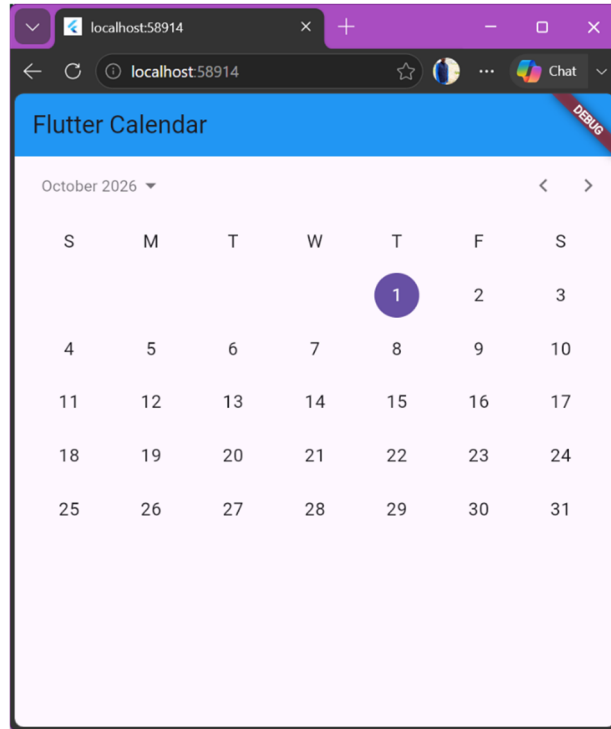

```
import 'package:flutter/material.dart';

void main() {
  runApp(
    MaterialApp(
      home: Scaffold(
        appBar: AppBar(
          title: const Text("Flutter Calendar"),
          backgroundColor: Colors.blue,
        ),

        body: CalendarDatePicker(
          initialDate: DateTime.now(),
          firstDate: DateTime(2020),
          lastDate: DateTime(2030),

          onChanged: (DateTime date) {
            print("Selected Date: $date");
          },
        ), //CalendarDatePicker
      ), //Scaffold
    ), //MaterialApp
  ); //runApp
} //main
```

RESULT:

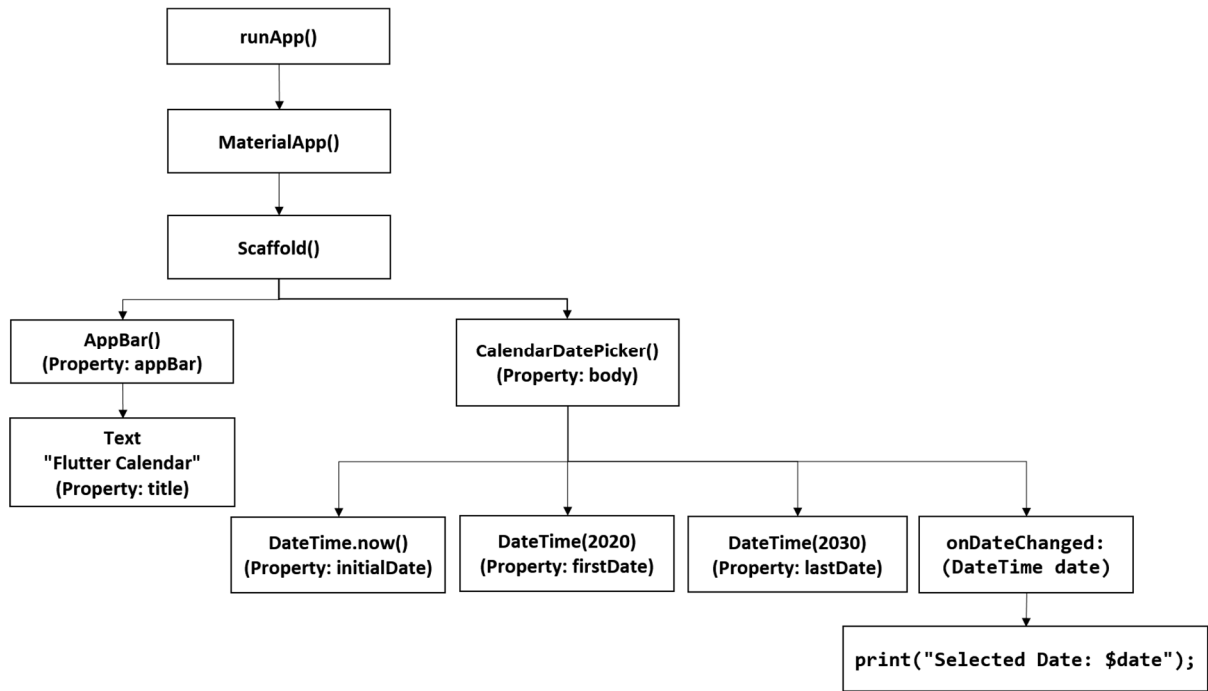

OUTPUT: Selected Date: 2026-10-01 00:00:00.000

FLUTTER CALENDAR CODE – EXPLANATION

Sno.	CODE	EXPLANATION
1.	CalendarDatePicker()	This is the main widget that displays a calendar and allows the user to select a date.
2.	initialDate: DateTime.now()	Sets today's date as the initially selected date.
3.	firstDate: DateTime(2020)	Specifies January 1, 2020 as the earliest selectable date.
4.	lastDate: DateTime(2030)	Specifies December 31, 2030 as the latest selectable date.
5.	onDateChanged: (DateTime date)	Defines an action that occurs whenever the user selects a different date.

WIDGET TREE:

WEEK-11 VIVA QUESTION & ANSWERS

SNo	Question	Answer
1	What is the purpose of this application?	It displays a calendar and allows the user to select a date.
2	Which widget is used to display the calendar?	CalendarDatePicker widget.
3	What is CalendarDatePicker?	It is a Flutter Material widget used to select a date from a calendar.
4	What does initialDate do?	It specifies the date that is initially selected in the calendar.
5	Why is DateTime.now() used?	It returns the current date and time, so today's date is initially selected.
6	What is the purpose of firstDate?	It specifies the earliest date that the user can select.
7	What is the purpose of lastDate?	It specifies the latest date that the user can select.
8	What is onChanged?	It is a callback function that executes when the user selects a date.
9	What does DateTime date represent in onChanged?	It represents the date selected by the user.
10	Where is the selected date displayed by print()?	It is displayed in the debug console, not directly on the application screen.
